

Who is Jeremy Duffy?

Jeremy is a “geek” and is similar to most other geeks you’ve met or heard of. With over 19 years of computer experience ranging from programming to secure system design, he’s well equipped to understand the benefits, but also the risks that come from “cyber” technology.

But unlike many technology professionals, Jeremy is an accomplished and award-winning public speaker. Having spent years teaching and training technology and risk management to government agencies, contractors, and the military, Jeremy has perfected his ability to explain complicated concepts in simple ways to audiences of all skill levels and backgrounds.

As a specialist in information risk management, Jeremy will explain how identity theft was caused by poor data handling practices and how properly applied privacy and data control will all but end the identity theft problem. Attendees can be expected to learn a little about the problem and a whole lot about the solutions that will make them many orders of magnitude less likely to become victims.

“You shared so much useful information that was new to our students and parents; you really contributed to the success of the day”

D.P., NSA Educational Outreach

“Very energetic speaker. Extremely knowledgeable. Great presentation. I’ve learned so much during this conference. Attended two of his lectures and enjoyed both.”

Attendee at National Operations Security Conference 2011

“You guys scored when he was hired! I have attended many OPSEC courses within the Air Force and DoD and by-far Jeremy was the best. Yes, understand he is 100% computer geek, but what an awesome dude! I got more from those three days than in any course or training that I have attended.”

G.C. , Air Force
